

MEDIUM VELOCITY DUAL FUEL BURNERS

MODEL : **MGHO**

BULLETIN : 202

Page 1 of 4

MGHO dual-fuel burners are nozzle mix, sealed in burner for gas, light or heavy oil. Capable of efficient operation throughout a wide temperature range, this burner is equally used at home on low temperature ovens and high temperature forge and melting furnaces.

Ruggedly built for sustained, maintenance free operation, this burner also provides for quick change of fuels without disturbing process operations.

Sealed mountings help maintain furnace pressure, controlled atmosphere, and closer air/fuel ratio control all contributing to better product quality.

COMBUSTION CHARACTERISTICS

Oil: Oil viscosity at the burner should not exceed 100 SSU.

Minimum atomizing air pressure at the burners is 70 mbar for light oil, 100 mbar for heavy oil.

Gas: Atomizing air (18 mbar minimum) should be left on. Maximum required natural gas pressure at the burner for stoichiometric ratio is about 1/4 combustion air pressure.

Air/Fuel Ratio: These burners are stable with at least 100% excess air. They also can operate with excess fuel without forming carbon, but additional air for complete combustion must be available in the furnace near the burner.

Turn down: MGHO can be turned down to atomizing air only (with fuel to match). For prolonged operation air only, specify an alloy burner nose if furnace temperature is above 800 °C.

Preheated Air: MGHO is designed for use with ambient air. They are suitable for some preheated air applications (up to 400 °C preheat).

SPECIFICATIONS

Flame Supervision: An ultraviolet cell will monitor pilot or main flame on gas or oil. For maximum safety SHOLEH SANAT urges interrupted pilots when flame safeguards are used , pilots should be on only for a preset ignition period, after which flame supervision detects main fire only.

Tile/Installation: Burner tiles are cast refractory rated for 1500 °C furnace temperature. They should be supported securely in the furnace wall by a layer of cast able refractory (not insulation) at least 9" thick all around the tile, extending back to the furnace shell and securely anchored to it. Tiles are replaceable in the field For furnace walls thicker than the length of the tile, tunnel beyond the end of the tile should be flared at least 30° angle, starting at the OD of the tile. Complete burners include tile, mounting plate, and an observation port into which a small quantity of atomizing air is introduced to keep the glass clear.

Main air capacities in SCMh

Burner Model	Main air pressure (mbar)					
	3.5	20	24	40	60	70
1500 MGHO	300	670	740	850	1040	1200
2500 MGHO	498	1110	1218	1440	1713	1982
4500 MGHO	1036	2322	2535	2946	3597	4135
7500 MGHO	1543	3456	3824	4362	5353	6175

Atomizing air capacities in SCMh

Burner Model	Atomizing air capacities in SCMh

DIMENSIONS - Main air, gas, atomizing air, and oil connections can be rotated relative to one another and to the mounting plate. Drawings show connections as assembled in the factory. These arrangements reduce maintenance by preventing oil dripping into air or gas manifolds (which should be above burners) and by minimizing dirt accumulation in pilots and flame supervisory devices. Pilot and main air connections cannot be aligned in the same direction.
